

ROM

Realtime Operational Management

Adaptive live multi-
location resource
planning

Where roster planning stops, I-SEC's operational planning application; ROM, begins. It transforms rigid and difficult day to day planning into flexible and structured planning.

Through utilization of the OPS system, we can create a roster a week, a month or even a year in advance, which ideally should be as accurate as possible. However, in a turbulent environment like an airport, the daily dispatch efficiency of your workforce is paramount to your operation. I-SEC, with more than a decades experience in major airport environments, created an innovative tool to deal exactly with this. ROM was created due to the fact that there was no tool available which could meet the high requirements of I-SEC; to transform a rigid roster in a versatile and flexible system. Over the last decade we have improved our operational planning system year by year in our own operation. We made sure that we were able to meet the steep demands set by the continuing growth of the transport industry.

Last year we upgraded the complete ROM platform into a new modernized system using latest and state of the art technologies. We added functionalities which accommodate the rising demands of our industry and simultaneously gives you the edge needed for improving daily efficiency.

Not only does ROM come with a complete multi-location check in and out system that allows you to know when an employee started and finishes his or her shift. The same system can be expanded to check-in and out of designated positions or tasks.

ROM:

- Allows you to work with multiple planners at the same time
- Supports multiple planning methods, like live planning and future planning. The future planning tool allows you to create a roster even a year in advance.
- Integrates multiple roster planning applications
- Allows you to export the daily changes back into your preferred roster application
- Gives a comprehensive overview of the actual planning supply and demand
- Automatic shift schedule notifications to your workforce by for example SMS or e-mail
- Create reports on your planning using the built-in reporting system and export the reports as PDF and excel
- Integrates with airport flight information systems
- Integrates with I-SEC's I-Check ECO system to display the current passenger flow
- Integrates with I-SEC's workforce management tool SARA and activates the SARA dashboard

ROM runs as a SAAS service or in own cloud or onsite.
